

2. BashaCare: Apartment Maintenance and Resident Requests

Background

A 12-storey, 48-flat building in Uttara, Dhaka. Monthly maintenance fee ₳2,500 per flat. The water pump fails every few weeks, the lift's AMC vendor drags repairs, parking disputes simmer, and everything ,complaints, vendor calls, bills ,flows through the building caretaker's personal phone. Residents complain that nothing happens after they report a problem. The committee approves bills with no visibility into which vendor is slow or where the money actually goes.

The problem today

- A resident reports a problem into a void: no ticket, no status, no answer to "when will it be fixed?"
- Urgent incidents (water leaking into the lift shaft) get the same treatment as routine requests (garden trimming).
- The committee treasurer cannot answer simple questions: what did we spend on the pump last year? How fast is the lift vendor really?

Cost of failure

- Lift down for two days strands elderly residents and triggers public complaints.
- Repeated patch repairs on a failing pump: ₳40,000+/year wasted on a machine that should be replaced.
- Opacity on spend is a committee re-election risk ,and buyers increasingly ask about building management.

Who is involved

Person	Their world	What frustrates them
Resident (e.g., flat 7-B)	Wants problems fixed, wants to know status	"Reported 3 weeks ago, no reply"
Caretaker / building manager	Fields everything, coordinates vendors	Everything in his head and call log
Committee (treasurer, secretary)	Budget, vendors, accountability	Approves bills blind; can't compare vendors
Vendors (lift AMC, plumber, electrician)	Do the actual work	Get blamed but rarely get clear job descriptions

What the product must do

1. Let a resident report a problem with a photo and see **their own request's status** ,from submitted to verified-closed ,without calling anyone.
2. Let building staff triage, assign to a vendor or in-house staff, and update progress with evidence (before/after photos).
3. Handle **urgent incidents differently from routine work**: an emergency (lift shaft leak) must visibly escalate ,faster acknowledgement, louder notification to the right people, a red flag on the manager's board ,while routine jobs queue normally.
4. Let the resident confirm the work was actually done before a request closes.
5. Record every job's cost, and give the committee spend by category and by vendor over time.

6. Make vendor performance visible: response time, repeat jobs, total billed ,so the pump-versus-replacement decision is data-backed.

Platform capabilities this case will exercise

A strong solution to this case will naturally need to draw on the full range of platform capabilities available — not just one or two. Concretely:

- Distinct sign-in and permissions for residents, caretaker/staff, committee members, and (optionally) vendors, so residents never see other flats' data or building finances.
- A structured request record per problem that carries status, assignment, and evidence from submission to verified close.
- Before/after photo evidence attached to each job.
- An urgent-vs-routine path with visibly different handling — faster acknowledgement and stronger notification for emergencies.
- Cost tracking per job, rolled up by category and vendor over time.
- A committee-facing view of vendor performance (response time, repeat jobs, total billed) built from the same underlying data residents use to report problems.

Access rules the business expects

- Residents see only their own flat's requests and updates ,never other flats' or the building's finances.
- Costs and committee decisions are visible to the committee and managers, not to residents at large.
- If vendors are given access, they see only their own assigned work.

Where AI should help

Residents write messages, not forms: "lift ta again kharap hocche, 3 din dhore majhe majhe jame, ami bonna ke niye 4 thake namte parsi na, emergency." The AI should propose a sensible **category, an urgency level with a stated reason, and a draft reply to the resident** ,which staff confirm or adjust before anything is applied or sent. Show at least one case where staff sensibly downgrade or upgrade the AI's urgency call.

AI enhancement challenge

The base case asks the AI to propose category, urgency, and a draft reply for one incoming message. Push it further: have the AI also look across a vendor's job history and flag when a 'routine' repair request is actually the Nth patch on the same failing equipment — surfacing a repair-vs-replace recommendation to the committee before they even ask for it.

Realistic demo case to script

Routine path: flat 7-B reports a lift fault with a photo → caretaker triages → lift AMC vendor assigned → resident watches status → work done, photo attached → resident verifies → closed. Complication: flat 10-A reports water leaking into the lift shaft ,the demo must show the emergency path diverge visibly (faster acknowledgement, escalation, red banner). Close on the committee view: six pump repairs in five months totaling ₹38,500 from one vendor, and the decision to replace instead of repair recorded on the case.

What "great" looks like

A committee member answers, in one screen: "Which vendor is slow, what did they cost us, and which urgent incidents are open right now?"
